

## Report - Assignment 2: 160010031+160010011

1) Loss function graphs - Dataset 1 and 2 in order.

a) Logistic Loss - No Regularizer (Only for dataset 1)

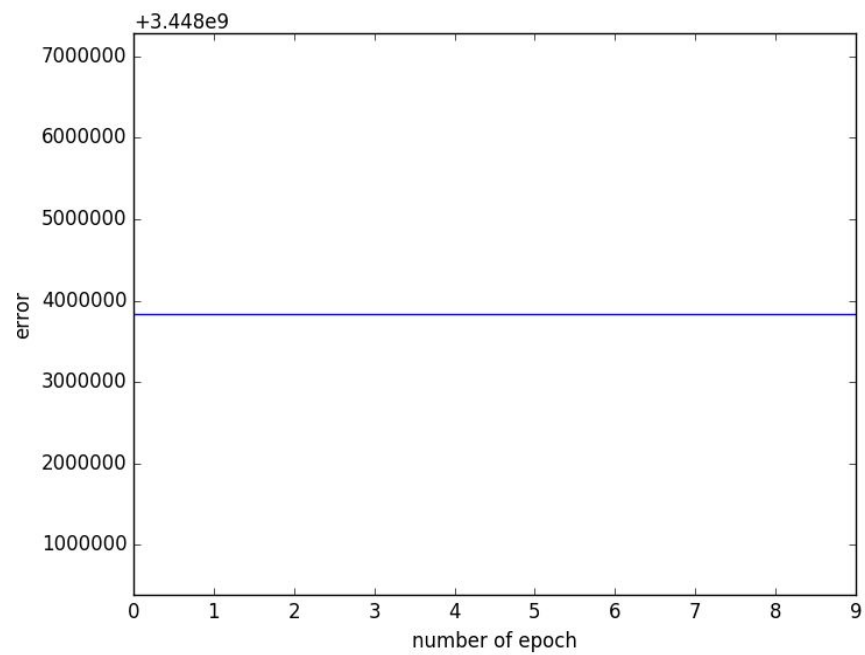

b) Logistic Loss - L2 regularizer (Only for dataset 1)

c) Logistic Loss - L4 regularizer (Only for dataset 1)

d) Sq. hinge Loss - No regularizer

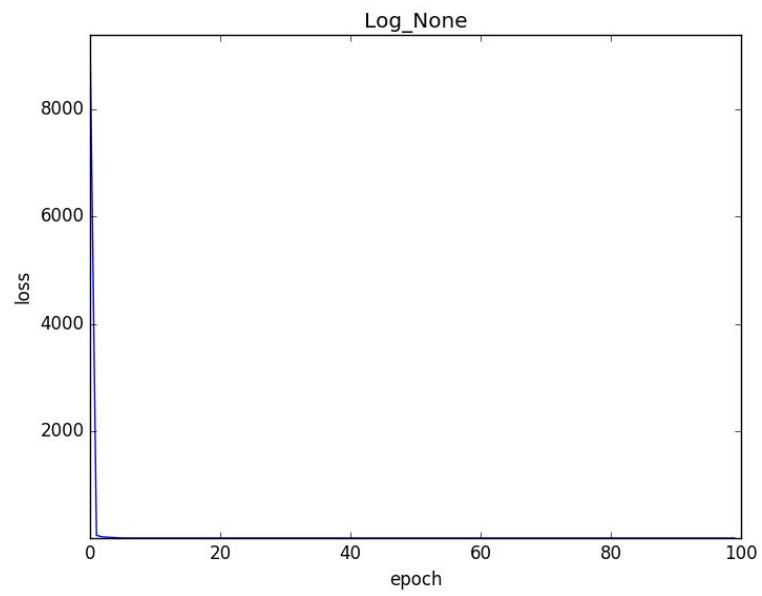

e) Sq. hinge Loss - L2 regularizer

f) Sq. hinge Loss - L4 regularizer

g) Perceptron Loss - No regularizer

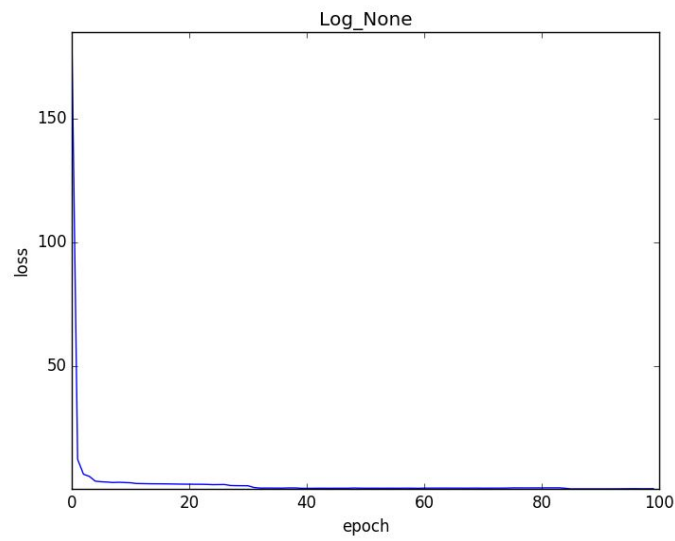

h) Perceptron Loss - L2 regularizer

i) Perceptron Loss - L4 regularizer

2) Observations from the above plot -

- a) L+No Regularizer - Linear Plot
- b) L+L2 - Decreasing plot wrt  $\text{epoch}^{-2}$
- c) L+L4 - Decreasing plot wrt  $\text{epoch}^{-4}$
- d) Sq + None - Constant
- e) Sq + L2 - Linear decrease then constant

- f) Sq + L4 - Exponential Decrease
- g) Percp + None - Const
- h) Percp + L2 - Linear decrease then constant
- i) Percp + L4 - Exponential Decrease - C used = 2

### 3) Preprocessing -

No data preprocessing.

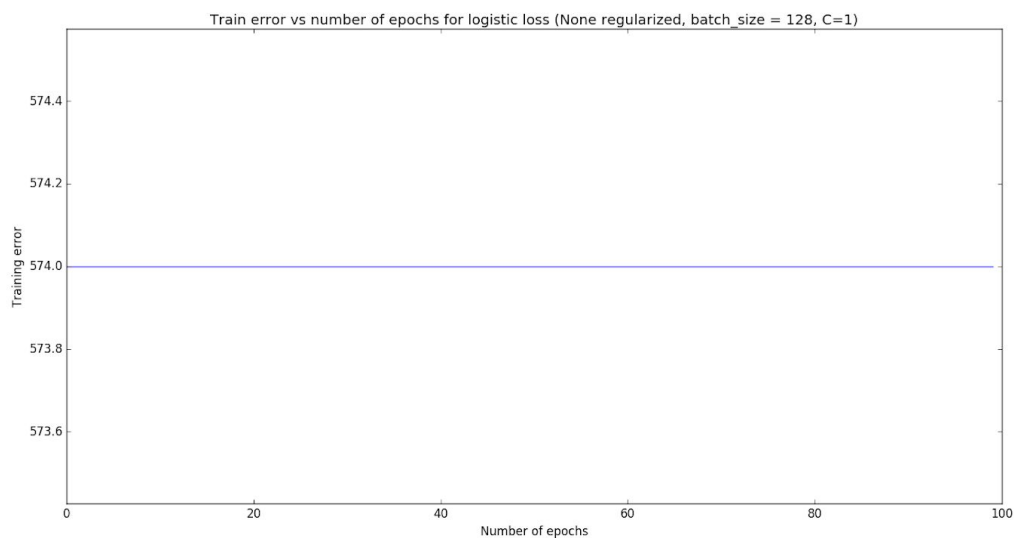

It was observed that -

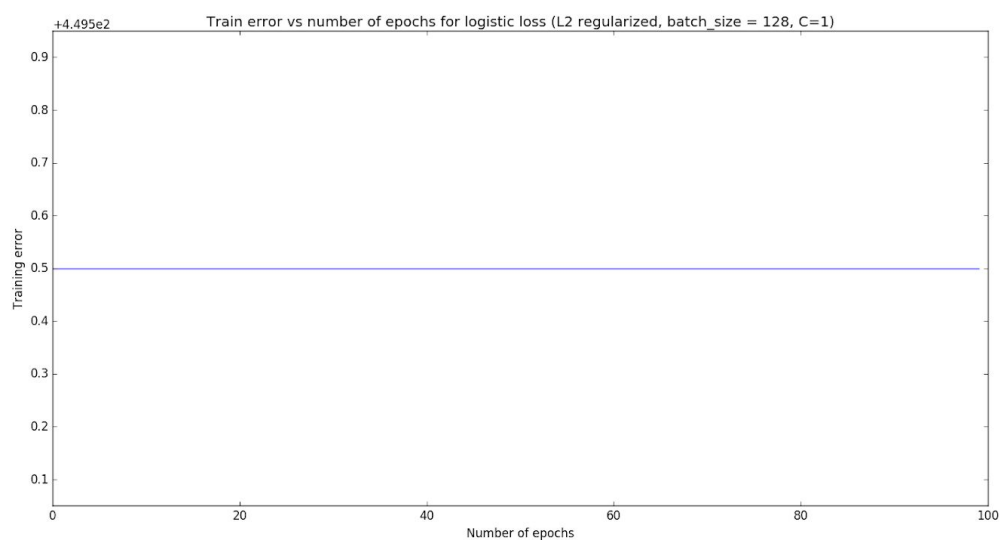

- a) When C was too low, the loss reduction was fairly slow.
- b) When C was large, then the loss would increase and oscillate.(Which is as expected)

## Training error graphs

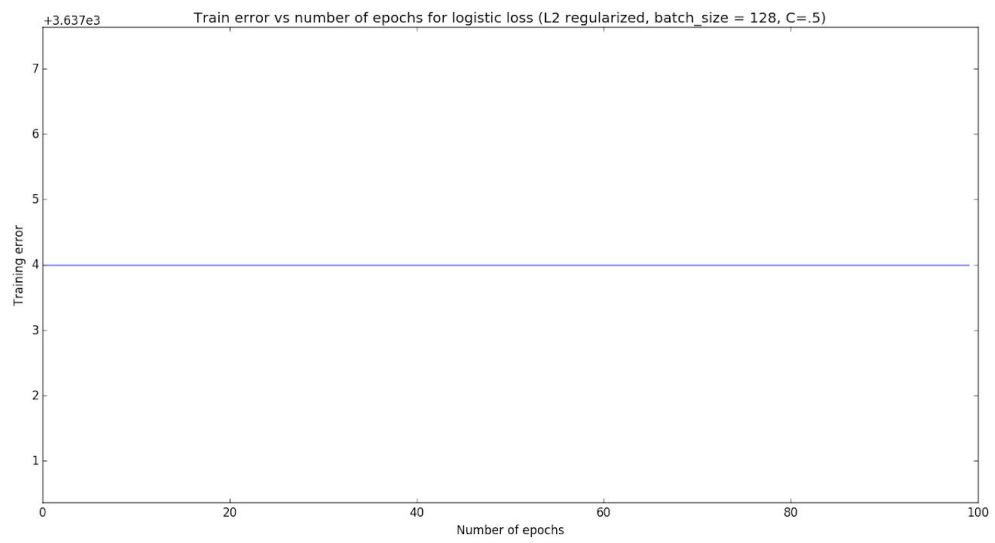

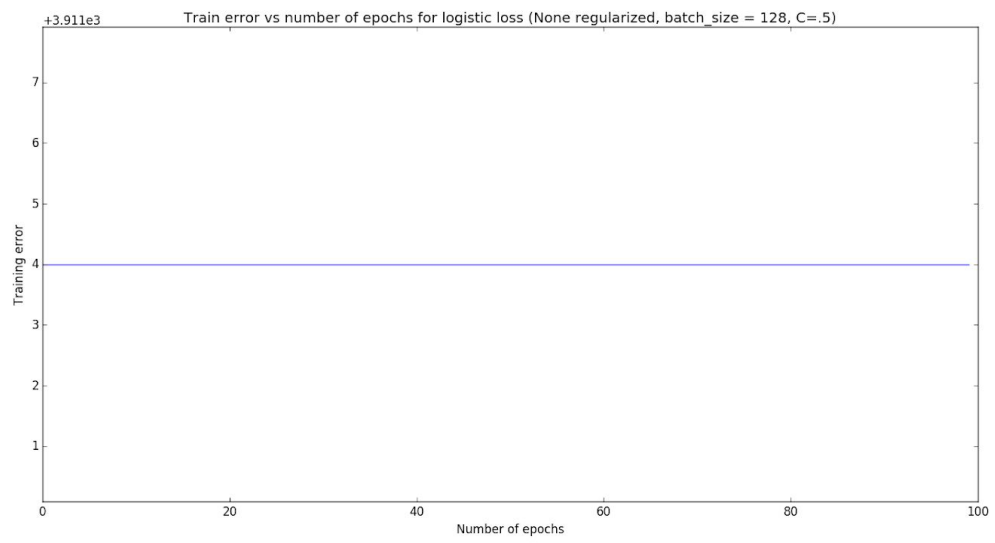

### Logistic Loss -

Dataset 1 -

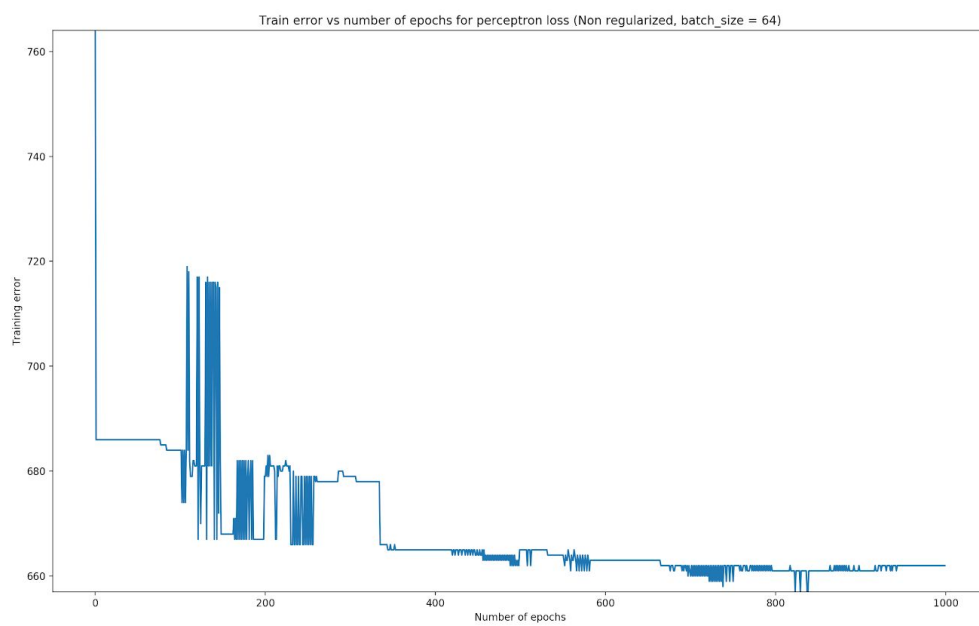

Dataset 2 -

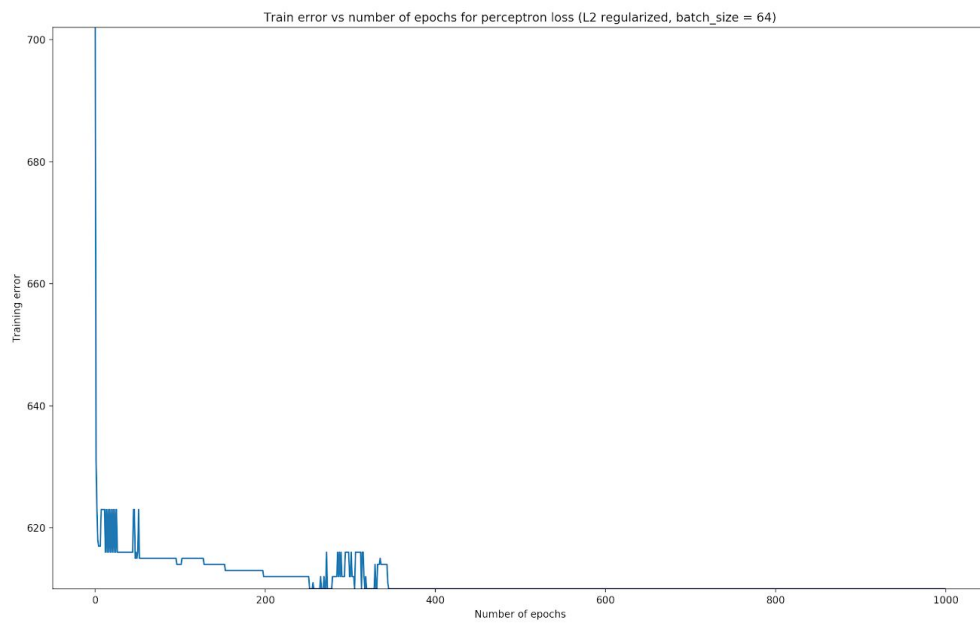

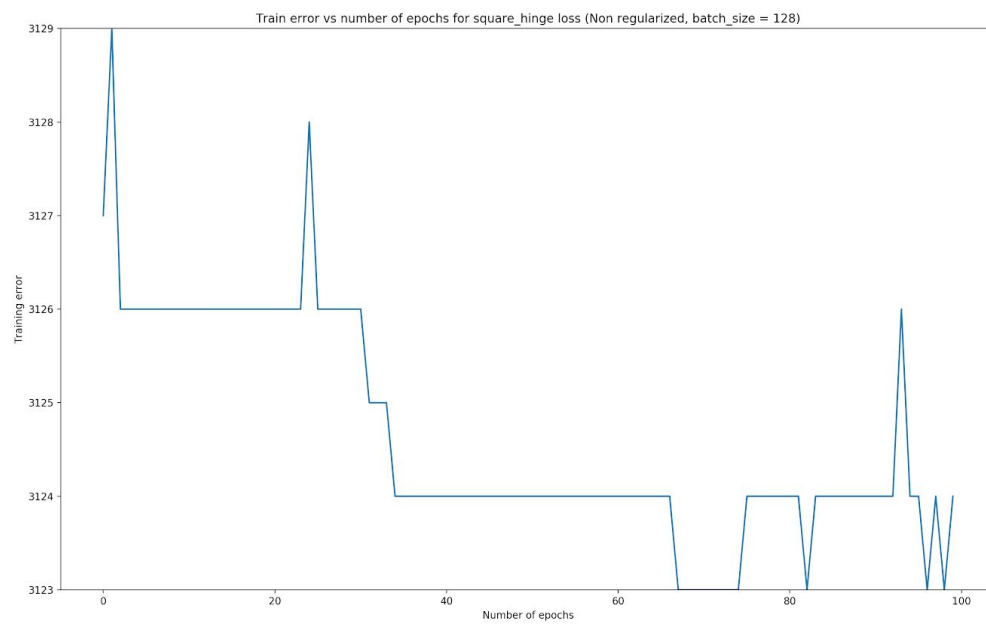

Perceptron loss

For dataset 1

Dataset 2

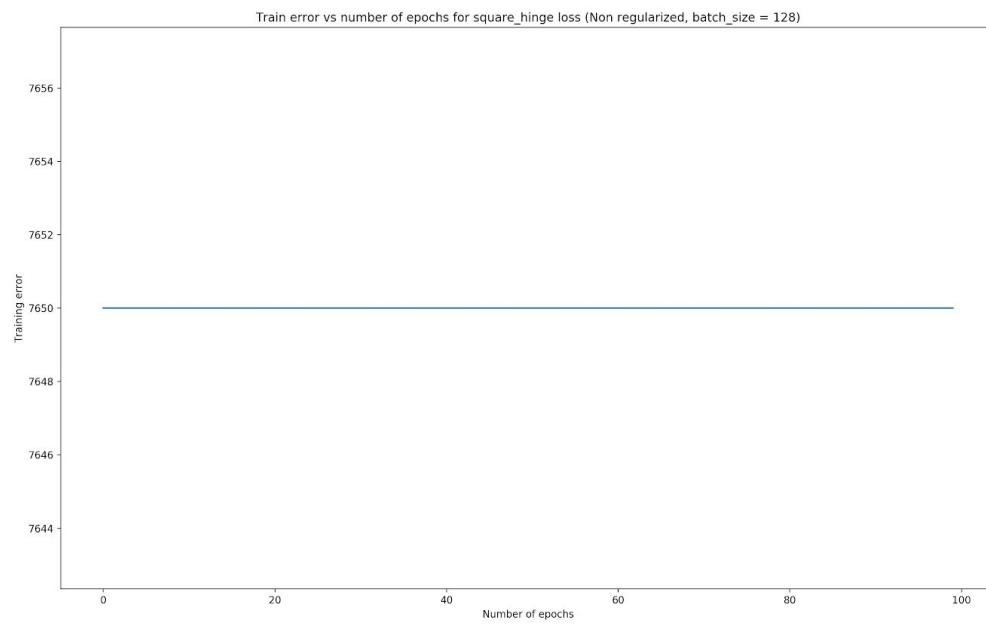

Square Hinge Loss

Dataset 2

Below graph is for L2 regularized (Graph Title is incorrect)

## Dataset 1

Observations from training error vs number of epochs

The changes in error due to square hinge loss and logistic loss is minimal due to very low gradient

Perceptron loss shows expected behaviour and best Kaggle score was obtained with perceptron loss.

Parameters used for best kaggle score:

Dataset 1

Batch\_size = 128

C = 2

Regularizer = L2 with lambda = 6

Perceptron loss

Dataset 2

Batch\_size = 512

C = 2

Regularizer = L4 with lambda = 5

Perceptron Loss
